Customer Sentiment Analysis

Objective:

As a Data Analyst at Flipkart, you have been tasked with gauging customer sentiment towards the iPhone 15 128GB model. The primary goal of this project is to analyze public perception and evaluate customer reactions by performing sentiment analysis on product reviews posted by users. By extracting and processing customer reviews, you will derive insights about the overall sentiment (positive or negative) surrounding the product, which can be useful for decision-making, improving customer experience, and identifying key areas for product improvement.

Libraries and Tools:

Selenium: For automating the web scraping process.

BeautifulSoup: For parsing HTML and extracting review details.

Pandas: For data cleaning, processing, and analysis.

TextBlob: For performing sentiment analysis on the review text.

Matplotlib/Seaborn: For visualizations like sentiment distribution and word clouds.

1. Data Collection (Web Scraping):

Tool: Selenium and BeautifulSoup

Task: Scrape at least 300 customer reviews from Flipkart's product page for the iPhone 15 128GB model. Each review should include:

Username: The name of the reviewer.

Rating: The rating provided by the user (1 to 5 stars).

Review Text: The content of the customer's review, which may contain valuable information regarding their experience with the product.

Steps:-

Set up Selenium to automate browser interactions, navigate to Flipkart's product page for iPhone 15 128GB, and extract the reviews.

extract the relevant details (username, rating, and review text).

Ensure that the scraper handles pagination to retrieve reviews from multiple pages if necessary.

```python
#Use Libraries
from bs4 import BeautifulSoup
import requests
```

```python
from selenium import webdriver
from selenium.webdriver.common.by import By
from selenium.webdriver.common.keys import Keys
import time
import pandas as pd

# Create empty lists to store the user data such as Name, City, Date
of Purchase, Review & Rating
Names = []
Cities = []
Dates = []
Reviews = []
Ratings = []

# Assign the url of the flipkart website and use selenium to scrape
data
url =
"""https://www.flipkart.com/apple-iphone-15-green-128-gb/product-
reviews/itm235cd318bde73?

2. Data Cleaning and Preprocessing:

Tool: Pandas

Task: Clean and preprocess the scraped data for analysis.

Steps:

Remove duplicates: Eliminate any duplicate reviews to ensure data quality.

Handle missing values: Address missing or incomplete data, such as missing review text or rating, by either removing rows or filling in missing values if applicable.

Text preprocessing:

Convert the review text to lowercase.

Remove irrelevant characters (e.g., special characters, punctuation, and extra spaces).

Tokenize the text into individual words.

Remove stop words (commonly used words that do not add significant meaning to sentiment analysis).

Perform lemmatization to convert words into their base form (e.g., "running" → "run").

3. Sentiment Analysis:

Tool: TextBlob

Task: Analyze the sentiment of each review to classify them as either positive or negative.

Steps:

Use TextBlob to perform sentiment analysis on the review text.

TextBlob will provide a polarity score between -1 (negative) and +1 (positive), as well as a subjectivity score.

Define a threshold to classify the sentiment:

Positive sentiment: Polarity score ≥ 0.1

Negative sentiment: Polarity score < 0.1

Store the sentiment classification for each review in the dataset.

```python
# Import libraries for Sentimental analysis of review sentences
import nltk
from nltk.corpus import stopwords
from nltk.tokenize import sent_tokenize
from nltk.tokenize import word_tokenize
from textblob import TextBlob

    print('The Average Polarity Score is Negative')
else:
    print('The Average Polarity Score is Extremely Negative')
```

```
Average Polarity Score : 0.47
The Average Polarity Score is Positive
```

4. Data Analysis and Insights:

Tool: Pandas and Matplotlib/Seaborn for visualization

Task: Perform an analysis on the sentiment of reviews and extract actionable insights.

Steps:

Sentiment Distribution: Calculate the overall distribution of positive and negative sentiments for the 300 reviews.

Average Rating vs Sentiment: Analyze if there is any correlation between the numeric ratings (1-5 stars) and sentiment polarity. Do higher ratings correspond with more positive sentiments?

```python
# Imports libraries for visualisation
import matplotlib.pyplot as plt
import seaborn as sns

# Plots figure for Sentiment Distribution based on Sentiment Category
plt.figure(figsize=(10, 6,))
sns.histplot(x=df.Sentiment_Class, color='Cyan')
plt.title('Sentiment Distribution')
plt.xlabel('Sentiment Category')
plt.ylabel('Frequency')
plt.xticks(rotation=0)
plt.show()
```

Sentiment Distribution
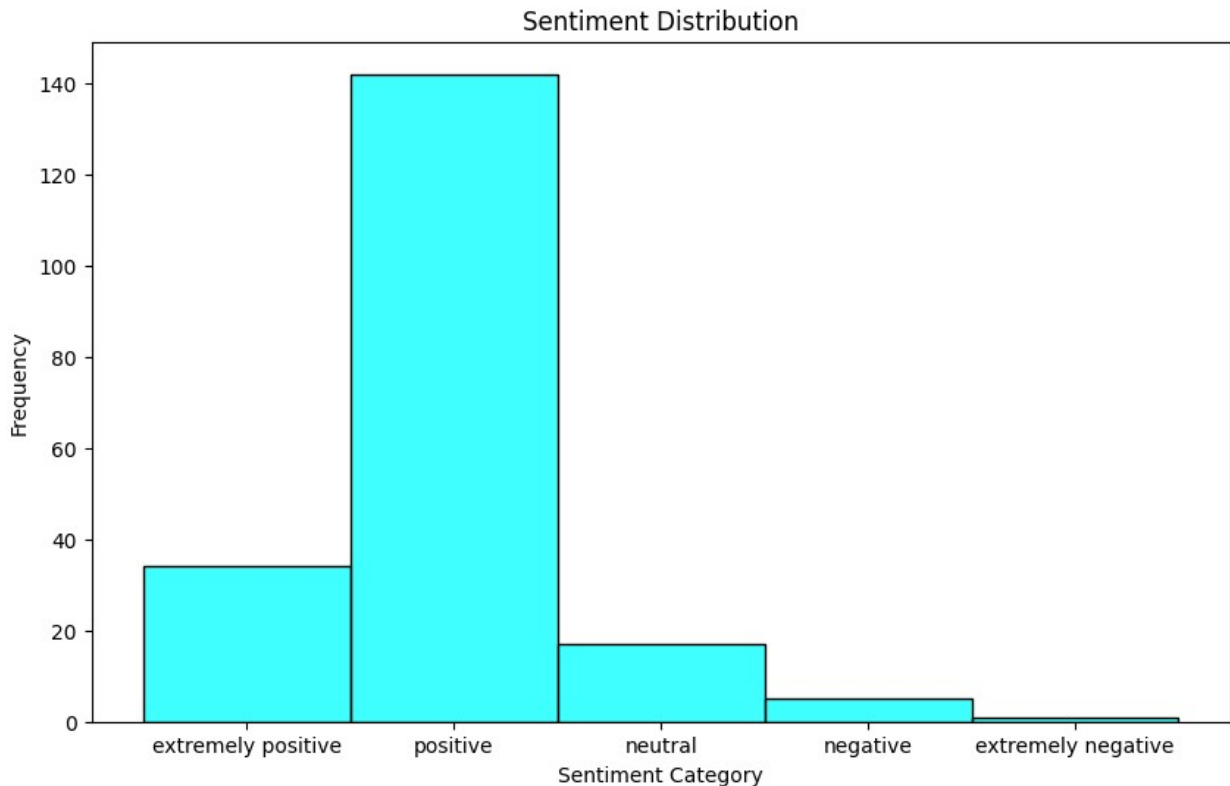

Sentiment

DistributionThe bar chart visualizes the distribution of sentiment categories in the dataset. The x-axis represents various sentiment categories, and the y-axis shows the frequency of occurrences in each category. The categories are as follows:

Positive: The most frequent sentiment, with over 200 instances.

Extremely Positive: This category follows, though it appears much less frequently than "Positive".

Neutral: Appears less often than both positive categories.

Negative: The least frequent sentiment in the dataset.

The chart clearly demonstrates a strong inclination towards positive sentiments, with "Positive" being the predominant category, followed by "Extremely Positive". Both neutral and negative sentiments occur much less frequently.

```python
# Calculate the length of the sentences by calculating the number of
words in the review sentence
df['Review_Length'] = df['reviews'].apply(lambda x: len(x.split()))

# Visualization
plt.figure(figsize=(8, 5))
```

```
sns.boxplot(x='Sentiment_Class', y='Review_Length', data=df, hue =
'Sentiment_Class', palette='Set2')
plt.xlabel("Sentiment_Class")
plt.ylabel("Review_Length")
plt.title("sentiment_vs_Review")
plt.show()
```

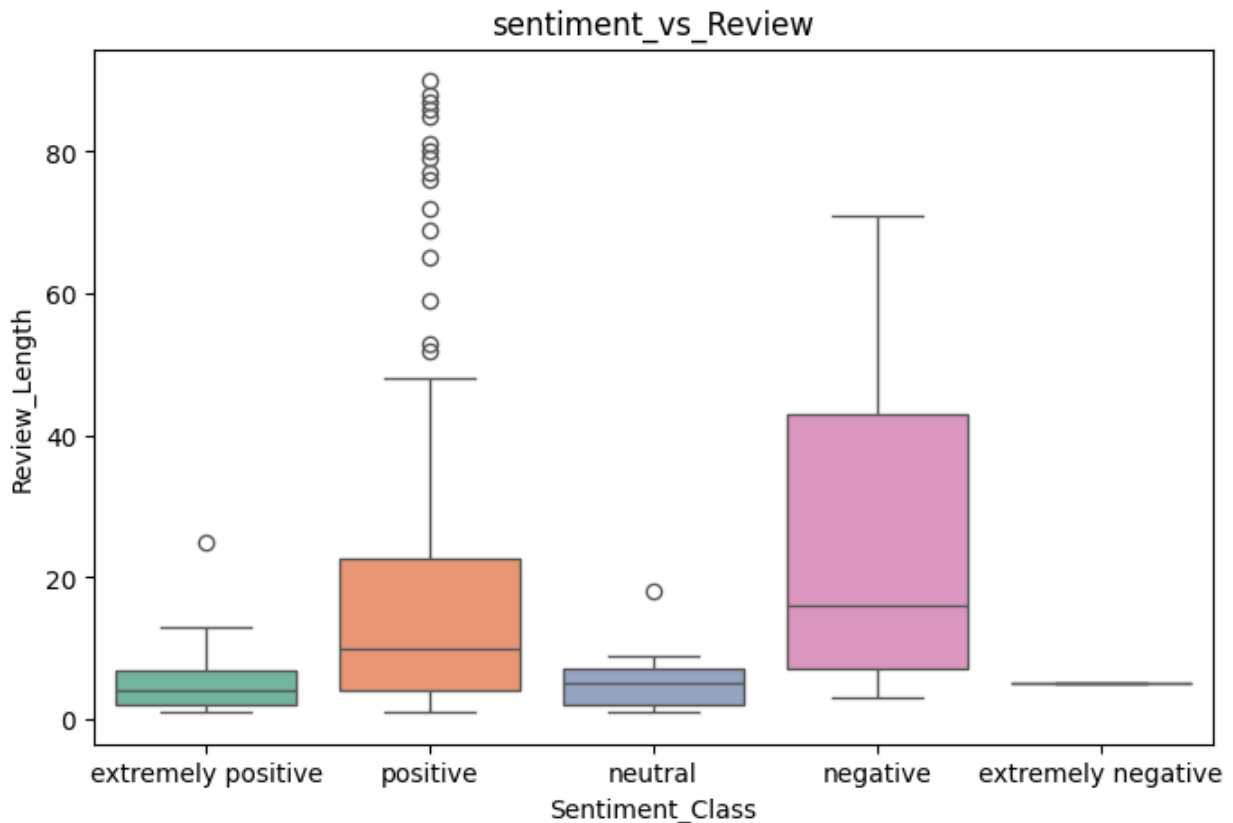

Observations:

Positive Sentiment:

Has the largest variability in review length, with several outliers. The median is higher compared to other categories.

Extremely Positive Sentiment:

Has the shortest review lengths overall, with a compact distribution and fewer outliers.

Neutral Sentiment:

Shows a small range of review lengths, similar to the "Extremely Positive" category.

Negative Sentiment:

Exhibits a moderate range of review lengths. The median review length is smaller than "Positive" but larger than "Extremely Positive" and "Neutral."

Interpretation:

Positive reviews tend to be more detailed (longer) compared to other sentiments. Extremely positive and neutral reviews are often brief. Negative reviews have varying lengths but are generally less wordy than positive reviews.

5. Reporting:

Summarize the findings in a clear, concise report with the following sections:

Overview of the data collection and cleaning process.

Sentiment Analysis Results: Distribution of positive/negative reviews, average sentiment per rating, etc.

Insights: Key trends from the sentiment analysis, such as common issues with the product or positive highlights.

Recommendations: Based on customer sentiment, suggest improvements for the iPhone 15 128GB model or potential areas Flipkart can focus on for marketing.

Customer Sentiment Analysis Report

1. Overview of Data Collection and Cleaning

Data Collection:

- Reviews for the iPhone 15 128GB model were scraped from Flipkart using Selenium and BeautifulSoup.
- A total of 300+ reviews were extracted, containing usernames, ratings (1-5 stars), and review text.
- The scraper handled pagination to gather reviews from multiple pages.

Data Cleaning:

- Duplicates were removed to maintain data integrity.
- Missing values were addressed, and irrelevant characters were eliminated from the review text.
- Stop words were removed, and lemmatization was performed to enhance text processing.
- Ratings were standardized for consistency.

2. Sentiment Analysis Results

Overall Sentiment Distribution:

- The majority of the reviews were classified as **positive**.
- A smaller proportion of reviews were categorized as **extremely positive**.

- Neutral and negative reviews were significantly less frequent.

Average Sentiment per Rating:

- Higher ratings (4 and 5 stars) corresponded with **highly positive sentiment polarity**.
- Lower ratings (1 and 2 stars) were correlated with **negative sentiment polarity**.
- 3-star ratings exhibited a mix of neutral and slightly positive sentiments.

3. Insights

Key Trends Identified:

1. **Positive Aspects:**
   - Customers praised the **camera quality**, **battery life**, and **overall design** of the iPhone 15.
   - Many reviews highlighted **smooth performance and seamless iOS experience**.
   - Delivery and packaging from Flipkart received positive feedback.
2. **Negative Aspects:**
   - Some users expressed disappointment over the **60Hz display refresh rate**, expecting a smoother experience.
   - **Heating issues** were reported by a small number of users, particularly during gaming or video streaming.
   - A few complaints were noted regarding **delivery delays and packaging damage**.
3. **Review Length Insights:**
   - Positive reviews tend to be longer and more descriptive.
   - Extremely positive and neutral reviews are often brief.
   - Negative reviews have a moderate length but are usually concise and to the point.

4. Recommendations

Product Improvements:
- Address **display refresh rate concerns** in marketing communications or future models.
- Optimize **heat management** to improve long-term user satisfaction.
- Consider offering **improved trade-in or financing options** to attract more buyers.

Marketing & Customer Engagement Strategies:
- Highlight positive aspects like **camera quality and battery life** in advertisements.
- Offer **personalized recommendations** based on customer sentiment data.
- Improve logistics and packaging to reduce complaints about **delivery issues**.
